

# Asset Security Monitoring

Monitor your whole security estate on a single pane of glass.

A managed monitoring service for your whole security estate - regardless of size, geography and manufacturer - is supported by certified analysts in our leading Cyber Security Operations Centre.

Security log monitoring, analysis and alert management is simplified as you detect activity of risk, mitigate threats, achieve compliance and improve your business' Cyber Security operations.

Organisations, whether single site or multiple sites, can generate millions of security log alerts every day. Recognition and analysis of these alerts and transforming them into meaningful information in real-time is so complicated and resource-consuming.

Asset Security Monitoring, managed by a team of certified security analysts, offers the focus and expertise required to meet your objectives. That means peace of mind 24 x 7, and the time and resources to concentrate on your core business.

Historically, SIEM and Security Monitoring technologies have been expensive, time consuming to install, and often offer low relative value without further investment in expensive analysts to translate the information into activity. We recognise this issue and support our customers by providing effective, responsive security monitoring for your whole cyber security estate - not just on the devices we supply. Achieve your security objectives with innovative, best-in-class solutions.

## Observation, Supervision, Care and Attention from Cyber Security Experts

Cyber Security Operations Centre (CSOC) have considerable experience in the deployment, configuration and support of cyber security monitoring systems.

The CSOC consists of cyber security practitioners who

are industry veterans with deep insight into the complexities and requirements of delivering solutions to achieve your security and compliance objectives. Smooth management of monitoring systems - with a keen focus on the end-user experience - identifies and analyses incidents effectively, enabling you to focus on your core business.

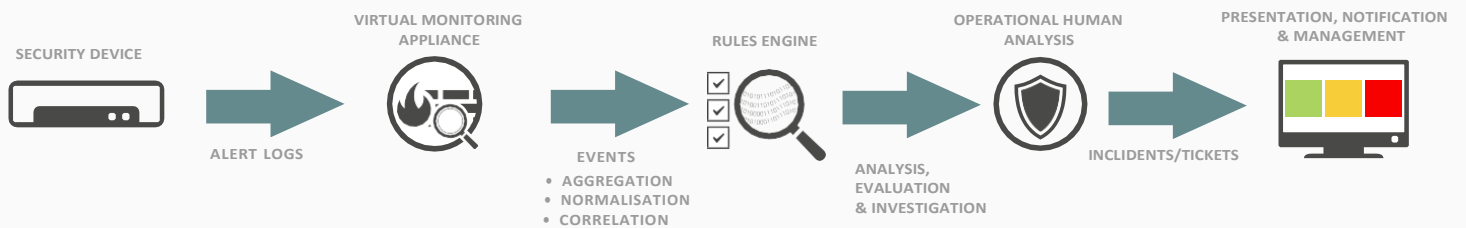

## How does it work?

The managed service platform consists of purpose built virtual data collectors and a cloud system which provides a customer portal which has all been specifically built from the ground up. This proprietary design is ideally suited to handle all of the unique technical requirements for achieving security best practices and compliance with industry standards.

Virtual monitoring devices are installed on virtual machines to track infrastructure syslog streams and collect data at each location. This provides a variety of tasks including aggregation, normalisation and correlation of Data - which also avoids the need to send native Data out of your Network. Pre-analysed and compressed evaluations are then securely transmitted to the central Cloud-based service where further computing and human analysis take place.

The Cloud-based monitoring system processes normalised Data through a set of business rules. This enables additional correlation and further processing against technology-specific, custom-designed rules that apply to your business.

In the Cyber Security Operations Centre (CSOC) automated analysis and processing presents Data to our Cyber Security experts for operational analysis. All actions are recorded in incident tickets providing transparency to technical teams while a management portal shows what has transpired, by whom and when on a single pane of glass.

## Service components

Asset Security Monitoring puts you in the driving seat of your business data and security operations.

The solution provides a proprietary platform offering full access to a management portal, incident identification & extensive reporting.

See a fully transparent, top-down view of your security operations through in-depth reporting and analysis.

### Asset Security Monitoring Features

### Security Monitoring & Analysis

Asset Security Monitoring Features	Security Monitoring & Analysis
Logging & Events	✓
Web Customer Portal	✓
Reporting	✓
Alerting	✓
24 / 7 x 365 Analysis	✓
Notification & Escalation	✓
Log Archiving (optional)	✓

## Features

- 24 x 7 real-time monitoring, analysis, alerting and reporting.
- Manual analysis by certified security experts.
- Easy integration with existing solutions and workflow products.
- Classify and manage business assets and security devices.

## Benefits

- Purpose-built system provides full security.
- Monitor your whole security estate.
- Flexible security management with advanced business logic.
- Multiple technologies, automation, and attack profiling.
- Save time managing and interpreting alerts.
- Simple deployment, onboarding and management.
