

# Managed Centralised Firewall Service

Savincom's Managed Centralised Firewall service protects your corporate Network from unauthorised access and other Internet security threats. Hosted inside our secure carrier class Data Centres, the service is provided as a virtual solution from the Cloud. Our customers benefit from cost savings which go with not having to purchase and maintain hardware at their own premises. Therefore total cost of ownership is vastly reduced.

## Why choose a Managed Centralised Firewall service with savincom?

Virtualisation partitions in the telecommunications industry allow delivery of more scalable and flexible solutions. We can provide your own dedicated virtualised Firewall. To ensure reliability the Firewall is duplicated to provide high availability and resiliency via the standard practice of active-passive pairing. The Managed Centralised Firewall service reduces business risk by providing direct access to accredited security experts.

We will design, configure and maintain our customers' firewalls on a 24 x 7 basis. As part of our Managed Centralised Firewall service we undertake all the regular software patching and upgrading, configuration changes and routine configuration back-ups.

Managed Centralised Firewalls provide tangible business benefits in the form of reduced risk, peace of mind, lower costs and economies of scale. As a fully managed service, it also provides Network integrity.

## Why choose our Firewall service over traditional customer site Firewall?

Our Managed Centralised Firewall service is fully managed by us and is provided from a central Cloud. Thus, making it simple for customers to scale their business. When our customers expand and open up new locations, the Managed Centralised Firewall service is readily available the moment they connect onto our Network.

There is no need for Network configuration and no need for purchasing additional hardware. The solution is built using multiple high availability resilient Firewalls working as an active-passive pair for failover purposes.

As a result, the service is highly robust and comes with our industry leading SLAs.

## This service best suits organisations who:

- Need to improve their Network security.
- Do not want to manage their Network security in house.
- Require a service provider to develop their security design.

## Why work with us?

Working with savincom to protect your data with our Managed Centralised Firewall will allow you, as a customer, to be prepared for the future. We work with you to grow when you do and future-proof your investment. This service compliments WAN and Internet connectivity services. Our business grade Internet access offers a dual stacked approach to IPV4 and IPV6 addressing schemes giving you and your business the best protection now and in the future.

## BENEFITS

- **A Cloud service** including all support, maintenance and upgrades.
- **Security** is enhanced, managed and maintained by accredited security experts.
- **Stringent SLA** agreement for peace of mind.
- **Scalable and flexible** so service grows with the needs of your business.
- **Firewall resiliency** as standard.

## SERVICE FEATURES

The Managed Centralised Firewall service is based on a purpose built large enterprise-grade security appliance for use as a virtualised solution. It works from the core Network, while we add a full service-wrap in the form of a host of support services to provide a fully managed solution.

## CENTRALISED FIREWALL FEATURES

- Control access to your Network.
- High availability as Standard.
- Stateful inspection.
- Control TCP port access.
- Supports Advanced Encryption Standard (AES).
- Supports digital certificates and two factor authentication.
- Health monitoring.
- Configuration backup.
- Hosted in secure Tier III Data Centres.

Standard service includes:

- Firewall throughput (Mbps) = 1000.
- Maximum security policies = 100.
- Maximum number of security zones = 3.
- Branch office IPSec VPNs = 10.
- User SSL VPNs = 100.
